# Zenia Care Launches Zenia AI & Completes Full Platform Rollout

Zenia Care today announced the launch of Zenia AI, an intelligent healthcare assistant designed to help patients interact with healthcare services through a conversational interface. The announcement also marks the completion of the full Zenia Care platform infrastructure.

Zenia AI allows users to interact with healthcare services through natural conversation. Patients can ask questions, book appointments, locate hospitals, view prescriptions, and access their medical reports through a single conversational interface integrated within the Zenia platform.

The AI assistant connects with the platform's backend infrastructure through a secure API layer that allows it to retrieve healthcare information, manage appointments, and guide users across different services available on the platform.

The conversational system supports multiple healthcare interactions including appointment scheduling, hospital discovery, prescription assistance, and medical report access. By integrating with the Zenia platform's infrastructure, Zenia AI helps reduce friction between patients and healthcare services.

The final platform version includes a comprehensive healthcare ecosystem consisting of patient dashboards, doctor management systems, appointment infrastructure, electronic health record tools, and medical report management systems.

MARCH 2026

*"Healthcare systems are often fragmented across multiple platforms. With Zenia Care, our goal is to create a unified system where patients, doctors, and healthcare facilities can interact seamlessly."*
